Sveiki Pauliau,

Kaip ir tarėmės siunčiame jums testinę užduotį.

Jonas ją surašė taip:

-----

## Adminpanel to manage companies

Basically, project to manage companies and their employees. Mini-CRM.

- o Basic Laravel Auth: ability to log in as administrator
- o Use database seeds to create first user with email [admin@admin.com](mailto:admin@admin.com) and password "password"
- o CRUD functionality (Create / Read / Update / Delete) for two menu items: **Companies** and **Employees**.
- o Companies DB table consists of these fields: Name (required), email, logo (minimum 100×100), website
- o Employees DB table consists of these fields: First name (required), last name (required), Company (foreign key to Companies), email, phone
- o Use database migrations to create those schemas above
- o Store companies logos in **storage/app/public** folder and make them accessible from public
- o Use basic Laravel resource controllers with default methods -

index, create, store etc.

- o Use Laravel's validation function, using Request classes
- o Use Laravel's pagination for showing Companies/Employees list, 10 entries per page
- o Use Laravel **make:auth** as default Bootstrap-based design theme, but remove ability to register

When finished, send a link to git repository with mini instructions for setup.
